

Mimecast Email Security, Cloud Gateway

Easily secure complex email environments. Customize policies. Integrate with and extend your security ecosystem. Get world-class email security efficacy.

Your must-have, AI-powered email security & resilience companion for M365 & Google Workspace

Email-based cyber threats continue to be one of the biggest risks organizations face. From phishing and ransomware to credential harvesting and zero-day attacks, the volume and sophistication of threats targeting your most essential communications tool continues to grow. Your work surface is now your risk surface.

Secure even the most complex email environments, customize policies to meet your specific needs, and extend protections through a range of complementary solutions with Mimecast Email Security, Cloud Gateway (CG). A Secure Email Gateway in the cloud, it uses AI-powered detection to defend against the most sophisticated attacks, while integrating seamlessly with M365 and Google Workspace to bolster defenses and achieve complete protection.

Key Benefits

- Secure any type of email environment - M365, Google Workspace, on-premise, cloud, hybrid
- Block the most dangerous threats with AI-powered detection
- Customize policies to meet your specific needs
- Easily manage large and complex email environments – AAA, FAA, frequent M&A
- Extend and simplify email protection with fully integrated, complementary solutions
- Easily integrate Mimecast with your larger security ecosystem

Emails inspected by Mimecast daily, giving us the industry's most robust view of the email threat landscape

Block all email-based threats

As the leader in email security for 20 years, Mimecast offers industry-leading detection and world-class efficacy trusted by 40,000 customers globally. By applying the right detection capabilities at the right time, Email Security CG surrounds your communications with continuous protection to block the most sophisticated threats, from phishing and ransomware to credential theft and zero-day threats. The industry's most robust view of the email threat landscape – derived from Mimecast's inspection of 1.3 billion emails daily – powers instantaneous blocking of the vast majority of email-based attacks, while the latest in AI and Machine Learning provides intelligent detection of both emerging and unknown threat types.

Limit attacker reconnaissance and empower employees with AI-driven warning banners

Email Security CG protects employees all the way down to the point of risk, applying Social Graphing to map communications patterns, identify anomalies, and detect attacks that use techniques like file-less malware and social engineering. AI-powered warning banners are then applied only to emails that warrant them and updated in real-time across devices when risk levels change. The solution also detects and alerts employees to potentially misaddressed emails and removes embedded email trackers that can reveal details, like the user's physical location, that can be used to create highly-targeted attacks.

Easily secure even the most complex email environments

Complex organizations often come with complex email security requirements – hybrid email deployments, regional and global differences, AAA or FAA, frequent M&A activity, and more. Email Security CG provides flexible and effective tools for managing large or complex email infrastructures, allowing for individual domains or divisions that require segmentation or separation of administrative duties — but with control retained by top-level administrators. Flexible policy inheritance ensures group or corporate level policies replicate down to regional or divisional business accounts.

Easily integrate Mimecast with your larger security ecosystem

Email Security CG accelerates and simplifies integration with other security technologies, such as SIEM, SOAR, TIP, XDR, and more. Integrating Mimecast with your other solutions and sharing intelligence from the top attack vector — email — is fast and easy, opening up endless opportunities to accelerate detection, speed response, reduce manual effort, and optimize investments.

Customize email security policies to meet your specific needs

Email Security CG offers protections that are optimized upon deployment while also supporting the policy customization and granular controls that many IT and security teams require, from user segmentation and quarantine settings to spam filtering, customization of inline education and warning banners, and more.

The solution's global policy engine is accessed through an intuitive, unified administration console that provides both ease of use and visibility.

Get complete protection for M365 and Google Workspace

Mass consolidation on M365 and Google Workspace has increased attackers' focus on these critical productivity platforms, with more and more threats specifically designed to evade their defenses. Email Security CG integrates seamlessly with these environments and uses AI-powered detection to shut down attacks that incumbent email providers miss.

Enhance protection with fully integrated, complementary solutions

One attack vector, one problem – what if that was all you had to solve for? You have to do more, so Mimecast does more too. Our fully integrated, complementary solutions let you address a wide range of challenges simply, effectively, and affordably.

DMARC management

Get full visibility and control of who sends emails on your behalf by accelerating and simplifying implementation of the DMARC protocol

Insider risk protection

Prevent attacks from spreading internally and to your supply chain by applying best-practice inspections to internal and outbound email

Continuity

Keep email flowing in the face of planned or unplanned downtime with easy to manage, intuitive continuity capabilities

Message encryption

Let users securely send sensitive information with message encryption that's easy for them to use and simple for you to administer

“Our global platform is often changing through mergers and acquisitions. We need partners that can scale with us and stay flexible.”

Erik Hart, Chief Information Security Officer, Cushman & Wakefield

As the top attack vector, email deserves more.

More than 90% of cyberattacks start with email. Get world-class email security designed for your organization's unique needs with Email Security CG.
