

Get Hands On

# MongoDB Developer Fundamentals Exercise

**Daniel Coupal**  
Senior Staff Developer Advocate  
Strategic Accounts

# Tool used for the workshop

No setup or installation

No firewall friction

Not MongoDB platform  
like Atlas, Compass, or  
Shell

Mimics a Web Service, so  
more code than just  
MongoDB operations

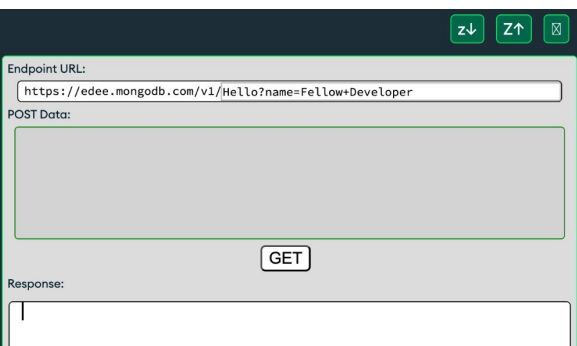

Time to open your laptops and discover the environment.

<https://edee.mongodb.com/?org=morganstanley25>

```

1
2
3 // get_XXXX or post_XXXX define Get and Post endpoints
4 // Both get passed a Request and a Response Object
5
6 function get_Hello(req, res) {
7   res.status(200);
8   res.send({ msg : "Hello " + req.query.get("name")
9             + " try looking at the examples."});
10 }
11
12

```

# Navigating

## Toggle between the IDE and the examples.

# Virtual MongoDB Day examples

## Lab 0 - Getting Started with the IDE

- A minimal web service
- Using the Request object
- Running code when service boots
- Environment variables

## Lab 1 - MongoDB Fundamentals

- Query by multiple attributes
- The Bucket pattern

## Lab 2 - Indexes, Locking and Transactions

- Indexed vs Unindexed query speed.
- Reading explain plans for queries.
- Create an optimal index.
- Using Multi Document ACID Transactions
- Observe transaction collision behavior
- Document level write locks.
- Long duration pessimistic locks.
- Long duration optimistic locks.

## Bonus Lab - Beyond the Basics

- Correctly querying Arrays with \$elemMatch
- Expressions in Queries
- Expressions in Updates
- Enforce schema on a collection
- CHALLENGE: Enforce calculated fields

## Bonus Lab - Aggregation

- Simple first aggregation
- Summarising data with \$group
- Determining cohorts with \$bucketAuto
- Join data from rapidly changing dimensions with \$lookup
- CHALLENGE: Power a Management Dashboard

## Other MongoDB Code Examples

- List and Drop Databases and Collections
- Query for Movies by title
- Load a batch of JSON documents
- List, Create and Drop indexes
- Atomic update with read
- Using Array Expressions like \$filter

```

1
2
3 // get_XXXX or post_XXXX define Get and Post endpoints
4 // Both get passed a Request and a Response Object
5
6 function get_Hello(req, res) {
7   res.status(200);
8   res.send({ msg : "Hello " + req.query.get("name")
9             + " try looking at the examples."})
10 }
11
12

```

Explanation

Response:

**Finding the code**  
There is a lot of code, a few lines send the operation to MongoDB.
